

ZYVORAI LABS · CUSTOMER DOCUMENTATION

Machina

Getting Started

2026-10-03

What you need

Requirement	Notes
Linux host with KVM/libvirt	Machina daemon builds/runs on Linux
URL	<code>https://<host>:5092</code> (TLS on by default)
Login	PAM (host Linux account) or LDAP/OIDC when configured
Browser	Modern Chromium, Firefox, or Safari

1. Open the dashboard

Open `https://<host>:5092` . Accept the self-signed certificate in labs, or install your org cert in production.

Health check:

```
curl -sk https://localhost:5092/api/v1/health
```

2. Sign in

Mode	What you do
PAM	Use your Linux username/password on the host
LDAP	Directory credentials when LDAP is enabled
OIDC	SSO via <code>/auth/oidc/login</code> when configured

RBAC roles: Admin / Operator / ReadOnly via `roles.json`, OIDC groups, or API tokens. Empty `roles.json` means everyone is Admin — fix that before production.

3. Orient yourself

After sign-in you get a **Mac-style desktop**: menubar (Zyvor mark + Machina / View / Window / Help), left **icon rail** sidebar, and Spotlight ( or Window menu).

1. **Sidebar** — pinned icons (Mission Control, VMs, Machine Finder, Hosts, Settings) plus Workloads / Infra / Ops / Secure / Admin section flyouts. Hover a section icon for its routes; chevron at the bottom expands labels.
2. **Platform** () — Mission Control for the fleet.
3. **Classic home** () — this hypervisor's guests and host health.
4. **Fleet Cloud** () — native instances; use the pill nav (Overview / Instances / ... / **More**).
5. Settings → Appearance → **Desktop density** (Normal / Power / Advanced) controls how much of the fleet surface is unlocked; **Apple** light theme is the default.

4. First workflows

A. List and open a VM console

`/vms` → select a VM → Console (VNC/SPICE/SSH/serial/RDP as available).

B. Create a VM

`/create` or Platform → VM Builder / Advanced Create.

C. Check host health

`/node` or Platform → Hosts.

D. Fleet Cloud

`/fleet-cloud` pages work out of the box — instances, images, volumes, security groups, networking, load balancers, and keypairs are all native, no external cloud connection or credentials required.

E. Containers (Vessel)

Infrastructure → Containers (`/containers`) when Podman/Docker is connected — see [Admin basics](#).

Next steps

- [Using the Dashboard](#)
 - [Admin basics](#)
 - [Page guides](#)
-

Machina's UI has a **classic host shell** (Core / Infrastructure / Fleet Cloud / Monitoring) and a **Platform** Mission Control experience for fleets.

Surfaces

Element	Purpose
Core nav	This-host VMs, create/import, fleet list
Infrastructure	Storage, networks, Containers (Vessel / Podman or Docker), Podman pods
Platform	Multi-host Mission Control, Zyra AI , Zeus Security , backups, SOC
Top-bar quick links	Settings, Host SSH, API Docs
Consoles	VNC, SPICE, SSH PTY, serial, RDP from VM detail

Browse vs act

Inventory pages are safe to explore. Create/delete VM, firewall, and Fleet Cloud mutations require Operator/Admin roles.

End-to-end jobs across Machina Core, Mission Control, and Fleet Cloud. Prefer console click-paths.

Create and console into a VM (this host)

1. **Core** → **Create VM** (`/create`) — install media or golden clone
2. **Core** → **Virtual Machines** (`/vms`) → open guest → **Console** / SSH
3. Optional: **Infrastructure** → **Containers** if you need Vessel containers on the same host

Fleet day-2 (Mission Control)

1. **Platform → Mission Control** (/platform) — Launchpad tiles live here (no separate /platform/launchpad)
2. **Hosts** (/platform/hosts) / **Machine Finder** (/platform/vms)
3. **Time Machine** backups (/platform/backups) as needed
4. **Zyra AI** (/platform/zyra) for fleet intelligence; **Zeus Security** (/platform/zeus/security) for Security Center

Fleet Cloud

1. **Fleet Cloud → Overview** ([/fleet-cloud](#))
2. **Create Instance** → pick image / flavor / network / keypair / security groups
3. Manage **Volumes, Networking, Load Balancers** as required — native Machina APIs (no external cloud wiring)

Migrate a VM in

1. **Migration Assistant** (</platform/migration>) — scan vCenter/ESXi/OVF/VMDK
2. Import wizard → confirm in **Machine Finder** (</platform/vms?lens=migration>)
3. Placement / HA (</platform/placement>) if you need DRS-style move

First-hour health check

1. Open `https://<host>:5092` — PAM/OIDC sign-in
2. **System Check** (`/system-check`)
3. **Dashboard** or **Mission Control** if enrolled
4. Create a test VM and open console
